

AutoPooper 3000 — Drum Size vs. Store-Bought

How your ~600mm drum compares to leading automatic self-cleaning litter boxes

Summary

Your drum's total interior cavity (~93.6 L) is about **1.3× the Petkit Purobot Ultra's** published 70 L drum capacity — the largest hard number found for a store-bought unit — and roughly **1.8×** an estimated Litter-Robot chamber. Your recommended litter fill (~8.4 L, from the seated litter-estimator mesh) is about **2× Litter-Robot's own recommended fill** of 1 gallon / 8–10 lb. AutoPooper 3000 is sized as a larger-capacity build than the market leaders, which should mean longer stretches between litter top-offs, at the cost of the bigger footprint and higher torque/material requirements already worked through.

Comparison table

	Total drum / chamber capacity	Recommended litter fill
AutoPooper 3000 (yours)	~93.6 L (600mm / 23.6" sphere)	~8.4 L
Petkit Purobot Ultra	70 L (manufacturer-stated)	—
Litter-Robot (3 / 4 / 5)	~53 L (estimated)*	~4 L / 8–10 lb (manufacturer-stated)

* Litter-Robot does not publish a total chamber volume. This figure is a rough cylinder approximation from their own published interior dimensions (15.75" × 15.75" entryway, 16.5" interior height) and likely overstates the true chamber slightly, since the actual globe is faceted/domed rather than a plain cylinder.

Notes

- Most manufacturers publish waste-drawer capacity ("goes N days without scooping") rather than drum/chamber volume, so hard total-capacity numbers are sparse across the market — Petkit's 70 L

and Litter-Robot's fill guidance were the most concrete figures available.

- “Recommended fill” is a small fraction of total chamber volume by design (yours: ~9%; Litter-Robot: ~7–8%) — automatic globes are built with a lot of empty headroom above the litter bed so the tumbling/sifting action has room to work.
- Figures for your drum come from the drum STL and the seated litter-estimator mesh from the companion litter capacity estimate.
