KODIGO

DIY heads-up display · clip-on or full frame

Setup Guide: the Kodigo app

Live captions and translation for people who are hard of hearing, on your phone today and on the Kodigo glasses later.

Version 1 · November 2026 · Hoofie Puppet's Workshop · hoofiepuppet.neocities.org/kodigo.html

In this guide

1. What you need
2. Set up an iPhone
3. Set up an Android phone
4. Use it on a PC or Mac
5. Using the app
6. If something doesn't work
7. Your own free Kodigo cloud (optional)

PART 1

What you need

- An **iPhone** (Safari), an **Android phone** (Chrome), or a **PC / Mac** (Chrome or Edge) with a microphone.
- An **internet connection** (Wi-Fi or mobile data). Turning speech into text happens online.
- The app's address: `hoofiepuppet.neocities.org/kodigo-app.html`
- **Nothing to buy, nothing to download from an app store.** The app is a web page you save to your home screen.
- Kodigo glasses are optional. Everything in this guide works on the phone screen alone.

What works where	iPhone	Android	PC / Mac
English captions	**Yes**	**Yes**	**Yes**
Tagalog / Taglish captions	**Yes, via Kodigo cloud**	**Yes**	**Yes**
Translation	**Yes**	**Yes**	**Yes**
Connect Kodigo glasses	With the free **WebBLE** app	**Yes**	**Yes**
Works with screen off / in background	**No**	**No**	Keep the tab open

PART 2

Set up an iPhone

> **Use Safari.**
> Chrome and other browsers on iPhone can't use the microphone for captions the same way. Open the app in **Safari** only.

1. **Turn on Dictation**
   Captions on iPhone use Apple's dictation.
   - **Settings** › **General** › **Keyboard** → **Enable Dictation**: **On**.

2. **Let Safari use the microphone**
   - **Settings** › **Apps** › **Safari** › **Microphone** → **Ask** (or **Allow**).
   - Older iPhones: **Settings** › **Safari** › **Microphone**.

3. **Open the app in Safari**
   Type `hoofiepuppet.neocities.org/kodigo-app.html` into Safari's address bar.

4. **Start captions once and allow the microphone**
   Tap **START CAPTIONS**. When Safari asks *"Allow microphone?"*, tap **Allow**. Say something: your words appear as text.

5 **Save it to your home screen**
Tap the **Share** button (square with an arrow) → **Add to Home Screen** → **Add**. A Kodigo glasses icon appears. Open Kodigo from that icon from now on.

> **If the icon won't use the microphone**
> just use it in a normal Safari tab. Some iPhones are stricter with home-screen web apps.

6 **Pick your settings**

- **Speech**: the language people around you speak.
- **Translate to**: the language you read best, or **Off**.
- **Listening**: leave on **Automatic**. On iPhone, Tagalog and Taglish switch to **Kodigo cloud** by themselves, because Apple's dictation doesn't understand Tagalog.
- **Text size**: drag until it's easy to read at arm's length.

7 **Glasses (later): install WebBLE**
iPhone browsers can't talk to Bluetooth devices on their own. Install the free **WebBLE** app from the App Store (iOS 26 or later), turn on its Safari extension when it asks, then tap **Connect glasses** in Kodigo. Not needed until you have Kodigo glasses.

PART 3

Set up an Android phone

1 **Open the app in Chrome**
Type `hoofiepuppet.neocities.org/kodigo-app.html` into Chrome.

2 **Start captions and allow the microphone**
Tap **START CAPTIONS**, then **Allow** when Chrome asks to use your microphone.

3 **Save it to your home screen**
Chrome menu ⋮ → **Add to Home screen** (or **Install app**) → **Add**.

4 **Pick your settings**
Same as iPhone: **Speech**, **Translate to**, **Listening: Automatic**, **Text size**. On Android, Tagalog works with the phone's own fast speech service.

5 **Glasses (later)**
Turn on Bluetooth, tap **Connect glasses**, pick your **Kodigo** glasses from the list. Nothing else to install.

Microphone blocked by mistake?
Chrome menu ⋮ → **Settings** → **Site settings** → **Microphone** → find **hoofiepuppet.neocities.org** → **Allow**.

PART 4

Use it on a PC or Mac

1. **Open the app in Chrome or Edge**
   `https://hoofiepuppet.neocities.org/kodigo-app.html` A microphone is needed (webcam, headset or laptop mic).
2. **Click START CAPTIONS and Allow the microphone**
3. **Captions from the computer's own sound (optional, Windows)**
   To caption a video or call playing on the PC without the room noise: right-click the speaker icon → **Sound settings** → **More sound settings** → **Recording** tab → right-click → **Show Disabled Devices** → enable **Stereo Mix** → **Set as Default Device**. Set your microphone back afterwards.

PART 5

Using the app

Phone's speech service

Fastest: words appear as they're spoken (cyan), about 1 second behind. Used for English and most languages.

Kodigo cloud (Whisper)

For Tagalog and Taglish on iPhone, or when you choose it. Captions appear a phrase at a time, 2–4 seconds behind. Free for about 3½ hours a day in total.

Good habits

- **Keep the screen on and Kodigo open.** Phones stop the microphone for web apps when the screen locks or you switch apps. Kodigo keeps the screen awake while it listens.
- **Put the phone near the person talking**, mic towards them. Captions get much better with less distance and less noise.
- **Translating** (Tagalog, Taglish or any language): the translation shows big, with the **original words small underneath**, so you can check both.
- The newest line is always at the bottom, with its time; older lines fade to grey. **Clear screen** empties the screen only.

The saved log

- Every caption is **saved on your phone** with its date and time, and comes back when you reopen Kodigo, so you can scroll up to see what was said earlier. Gaps of more than 30 minutes get a date divider.
- **Save as text file** downloads the whole log (`kodigo-log-YYYY-MM-DD.txt`): **iPhone**: tap **Download**, then find it in the **Files** app → **Downloads** (Safari's downloads arrow ↓ also shows it); **Android**: **Files** / **Downloads**; **PC**: your **Downloads** folder.
- **Copy all** puts the whole log on the clipboard to paste into Notes, a message or an email.
- **Delete log** (tap twice) erases it from the phone for good.
- The log stays **only on that phone**; nobody else can see it, and it isn't sent anywhere. On iPhone, use the **home-screen icon**: Safari can wipe saved data for websites not visited for 7 days.
- Your speech is turned into text by Apple, Google or Kodigo cloud (Cloudflare) and then shown on your screen; Kodigo itself keeps nothing online.

PART 6

If something doesn't work

The app shows a message under the buttons, and a small grey **Log:** line. Find the message here:

The app says	What to do
Mic blocked	Allow the microphone for the site. iPhone: in Safari tap **aA** → **Website Settings** → **Microphone: Allow**. Android: see the tip in Part 3. Then reload.
Speech recognition is switched off	iPhone: **Settings › General › Keyboard › Enable Dictation: On**; Siri switched on; Screen Time not blocking Speech Recognition. Use a Safari tab, not the home-screen icon.
Can't listen in <language>	The phone's speech service doesn't know that language. Set **Listening** to **Kodigo cloud** (or Automatic).
Captions paused, tap Start	iPhone stopped listening by itself. Tap **START CAPTIONS** again.
Kodigo cloud's free minutes are used up	The day's free allowance is gone; it comes back at **8:00 AM Philippine time**. To never share minutes again, make your own free Kodigo cloud (Part 7). English still works with Listening set to the phone's service.
Can't reach Kodigo cloud	Check Wi-Fi or mobile data.
Captions stop when the screen locks	Normal for web apps: keep Kodigo open with the screen on.
Odd words in silence	Kodigo cloud sometimes "hears" a phrase in noise. Move closer to the speaker or to a quieter spot.

Still stuck? Open **How to use / install** in the app and send the line after **"Problems?"**, plus a screenshot of the Log, to the SysOp (**[Y] Yell for SysOp** on the BBS).

PART 7 · OPTIONAL

Your own free Kodigo cloud

Kodigo cloud does the Tagalog and Taglish captions on iPhone. The shared one is free but is **shared by everyone** (about 3½ hours a day in total). If it runs out, or you use Kodigo a lot, make **your own**: it's free, gives you **your own 3½ hours every day**, and takes about 10 minutes. **No coding**: you copy, paste and click.

> **Before you start**
> Use a **PC or laptop** (easier than a phone). You'll need a free **Cloudflare** account. On the free plan Cloudflare can't charge you: it just stops for the day when your minutes are used (back at 8:00 AM Philippine time).

A. Make the worker

1. **Open Cloudflare**
   Go to `dash.cloudflare.com` and log in (or **Sign up** for a free account).
2. **Workers & Pages**
   In the menu on the left click **Workers & Pages** (it may be under **Compute**).
3. **Create**
   Click the blue **Create** button, then **Start with Hello World!**
4. **Name it**
   In **Worker name**, delete the random name and type `kodigo-listen`. Click **Deploy**.

B. Paste in the Kodigo code

1. **Edit code**
   Click **Edit code** (top right). A code editor opens.
2. **Empty it**
   Click inside the code on the left, press **Ctrl + A**, then **Delete**.
3. **Copy the Kodigo code**
   In a new tab open
   `raw.githubusercontent.com/HoofiePuppet/workshop-files/main/kodigo/worker/kodigo-listen.js`
   , click on the page, press **Ctrl + A**, then **Ctrl + C**.

4. **Paste and deploy**
   Back in the editor press **Ctrl + V**, then click **Deploy**. Nothing in the code needs changing.

C. Switch on the AI

1. **Back to the worker**
   Click **kodigo-listen** at the top left, then the **Settings** tab.
2. **Add binding**
   In the **Bindings** box click **+ Add binding**, pick **Workers AI**, click **Add Binding**.
3. **Name it AI**
   In **Variable name** type `AI` (two capital letters), then click **Add Binding**. If an orange box about "Wrangler" appears, just close it.

D. Check it, then connect the app

1. **Find your address**
   On the worker's **Overview** page it's at the top, like `kodigo-listen.yourname.workers.dev`.
2. **Check it**
   Open that address in a browser. You should see `"ai":true` at the end.
   - `"ai":false`: redo part C and check the name is exactly `AI`.
3. **Put it in the app**
   In the Kodigo app open **Your own Kodigo cloud** (under the buttons), paste your address, and tap **Save & test**. A green ✓ **Works! Saved.** means you're done. Do this once on each phone you use.

> **Only for people hosting their own copy of the Kodigo app**
> Your worker accepts the official Kodigo app (`hoofiepuppet.neocities.org`) as it is. If you put the app on your own website, add your site's address to `ALLOWED_ORIGINS` near the top of the worker code (keep the quotes and comma), and Deploy again.
